

# WP1: Land carbon reanalysis ORCHIDEE driven by CERA-20C

*Philippe Peylin, Nicolas Vuichard, Vladislav Bastrikov,  
Palmira Messina & the ORCHIDEE project team*

Laboratoire des Sciences du Climat et de l'Environnement  
CEA/CNRS/UVSQ, IPSL, France

# Overall proposed contribution

---

- ➔ Adding the C-cycle to the reanalysis
  - 110-year reanalysis with CERA-20C Done
  - 9-year reanalysis with CERA-SAT Partly
- Surface C fluxes & uncertainties:
  - land (Net and Gross) fluxes
  - anthropogenic (fossil + LUC)
  - separated for Forests, Grass, Crops
- Land C stocks & uncertainties:
  - Aboveground & Belowground C pools

# Global Carbon Budget

LAND  
focuss  
with  
ORCHIDEE  
(& CTESSEL)

Since 1750, human activities have emitted  $555 \pm 85$  PgC (Fossil fuel + Luse)

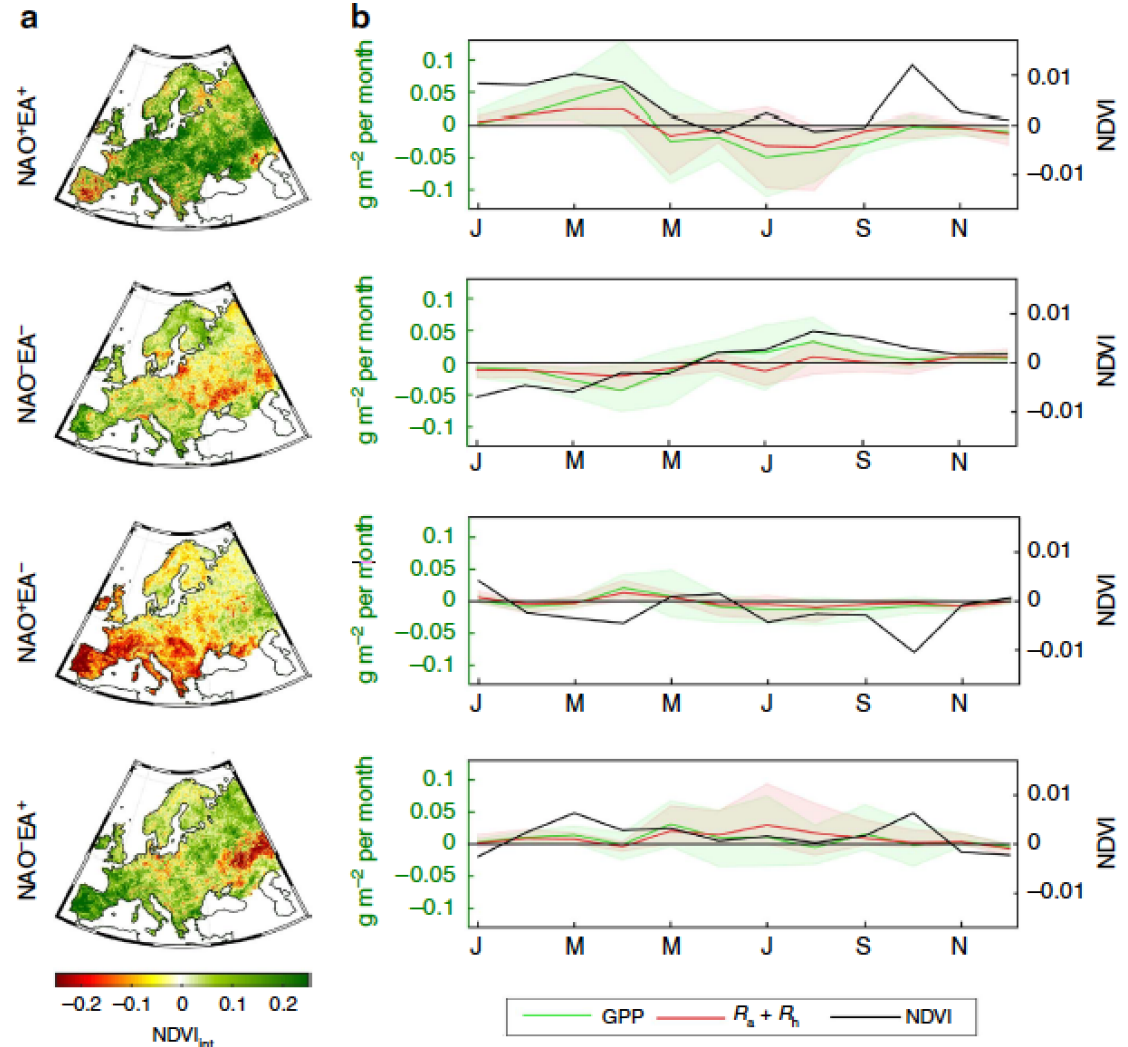

Fossil fuel CO<sub>2</sub> emissions are  $\approx 10$  PgC yr<sup>-1</sup> in 2015 (55% > 1990 level)

Over the past 50 years,  $44 \pm 6$  % of emissions remains in the atmosphere

# European land CO<sub>2</sub> sink influenced by NAO and East-Atlantic Pattern coupling

Ana Bastos<sup>1,2</sup>, Ivan A. Janssens<sup>3</sup>, Célia M. Gouveia<sup>2</sup>, Ricardo M. Trigo<sup>2</sup>, Philippe Ciais<sup>1</sup>, Frédéric Chevallier<sup>1</sup>, Josep Peñuelas<sup>4,5</sup>, Christian Rödenbeck<sup>6</sup>, Shilong Piao<sup>7</sup>, Pierre Friedlingstein<sup>8</sup> & Steven W. Running<sup>9</sup>

for Europe

# Global Vegetation Model: ORCHIDEE

**Simulates the Energy, Water and Carbon balance  
Land component of the IPSL Earth System Model**

LSCE

# Progresses made in 2017..

1. Update of the ORCHIDEE model; improvement of biophysical and biogeochemical processes
2. Parameter calibration through “data assimilation”
3. Performed several simulation with different
  - Climate forcing (CERA-20C, CERA-SAT, CRUNCEP,...)
  - Land cover scenario
  - Model version
4. Finalize the dedicated web-site to view all results
5. Process the data for easier access by all users

Climate reanalysis  
(several variant)

Land cover scenarii  
(using ESA-CCI land cover  
& LUH historical products)

Model development  
New processes  
Optimal parameters

ORCHIDEE forcing

U and V wind at 10 meters  
Specific humidity  
**Temperature at 2 meters**  
**Rainfall**  
Snowfall  
**Solar radiation downward**  
Thermal radiation downwards.

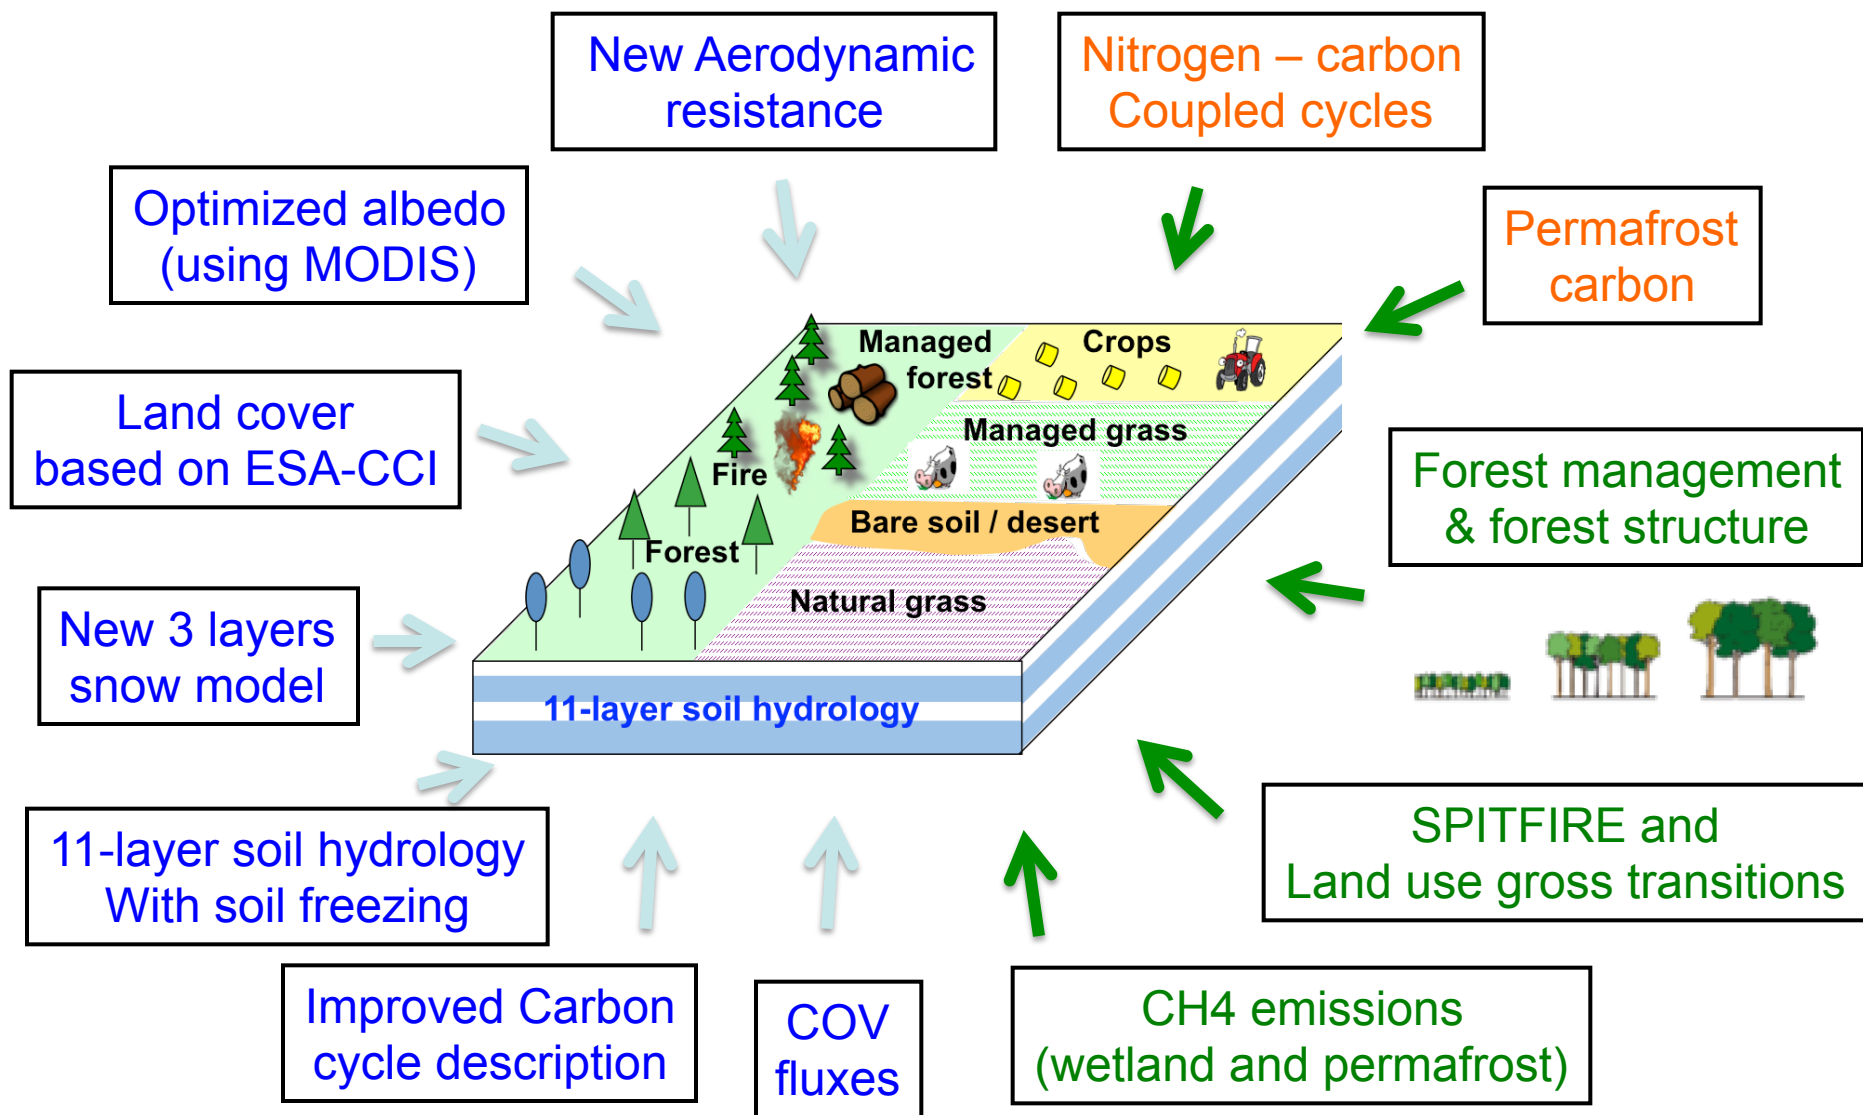

# ORCHIDEE developments for CMIP6

**Implemented: V1**

**Soon...: V1.5**

**Merging**

LSCE

# Simulation setup (CERA-20C)

1901

2010

**Spin-up simulation:** 340 years, same land use 1860 (pre-industrial), CO<sub>2</sub> fixed

**Transient simulation:** 40 years, land use and CO<sub>2</sub> from 1860 to 1900

**Historical simulation:** varying CO<sub>2</sub> and land use every year

# Simulations performed

- 3 model versions : R1, R2, R3
- 5 climate forcing: F1 – F5
- 3 land cover : LC1 – LC3

Nb	Title	Model version	Res.	Meteo forcing	Land cover	Period

LSCE

# Issues & ongoing work

- Late preparation of the CERA-SAT forcing
  - ➔ Simulation without a complete spin-up
  - ➔ Analysis of the gross fluxes only (GPP)
  - ➔ Delays in the deliverables
  
- Simulation with another climate member (CERA-20C) is still ongoing.
  - ➔ We choose to run in priority other climate forcing
  
- ➔ All simulations / data-set will be available at the end of 2017 !

- Using a « dods » server:

1. All proposed simulations nearly completed  
D1.2 completed ; D1.4 (CERA-SAT) this week.
2. CERA-20C / CERA-SAT ORCHIDEE Carbon reanalysis  
compare well to other products (CTESSEL, ...)
3. CERA-20C lead to lower GPP ; large climate anomalies  
with significant impact on the C fluxes and stocks
4. Change of ORCHIDEE model parametrization  
lead to large flux differences
5. Consolidated web-site for "all users" !
6. → Evaluation/synthesis article in preparation

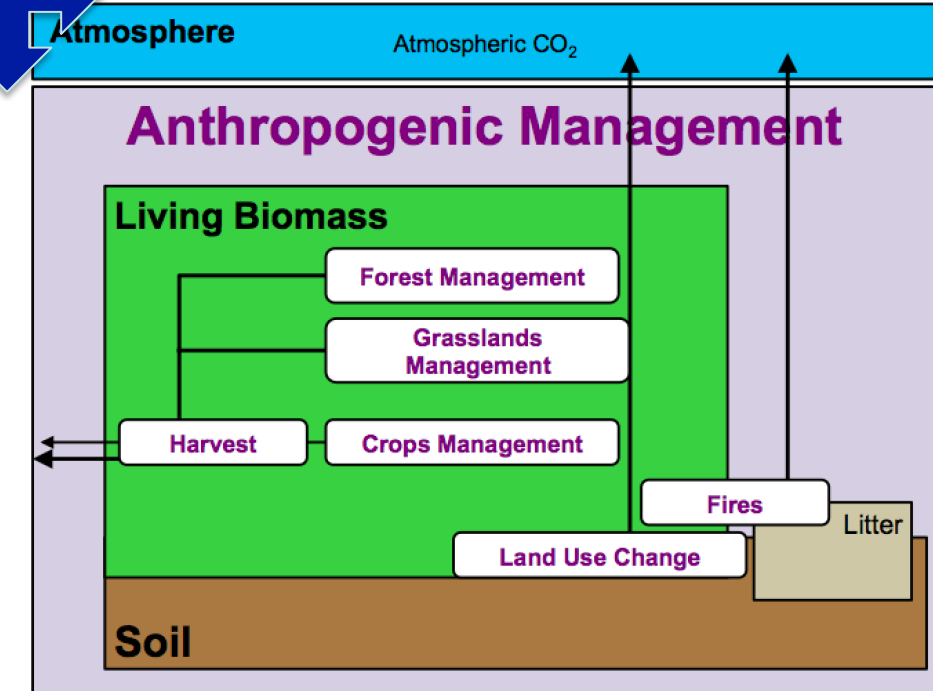

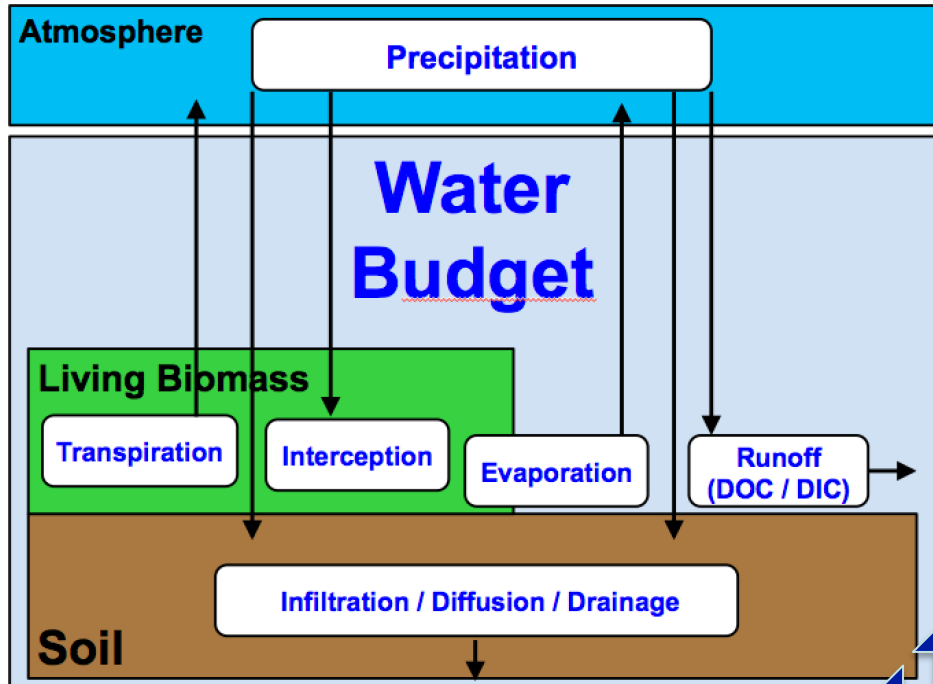

→ Including the C cycle in a global reanalysis may help for future downstream services..

Thank you...
