Can we use the model fields on a *coarse grid* to forecast the precipitation on the *fine grid*? This task is known as *downscaling*.

 $1.2\pm1.5\,\text{mm}$

But the prior is subjective!

э

But the prior is subjective!

We use Gibbs sampling to split the posterior into two parts

• Sample $Z_t | \beta, Z_{1:T \setminus t}, y_{1:T}, x_{1:T}$

We use Gibbs sampling to split the posterior into two parts

- Sample $Z_t | \beta, Z_{1:T \setminus t}, y_{1:T}, x_{1:T}$
- Sample $\beta | y_{1:T}, Z_{1:T}, x_{1:T}$

We use Gibbs sampling to split the posterior into two parts

- Sample $Z_t | \beta, Z_{1:T \setminus t}, y_{1:T}, x_{1:T}$
- Sample $\beta | y_{1:T}, Z_{1:T}, x_{1:T}$

We use slice sampling and elliptical slice sampling.

We use slice sampling to sample $Z_t | \beta, Z_{1:T \setminus t}, y_{1:T}, x_{1:T}$.

We use slice sampling to sample $Z_t | \beta, Z_{1:T \setminus t}, y_{1:T}, x_{1:T}$.

•
$$y_t = 0 \Rightarrow Z_t = 0$$

Slice sampling:

- $s \sim \text{Uniform}(0, \pi(z^{(i)}))$
- $z^{(i+1)} \sim \mathsf{Uniform}(z:\pi(z) > s)$

We use *elliptical* slice sampling to sample β .

We use *elliptical* slice sampling to sample β . It can sample a posterior with a Normal prior.

We use *elliptical* slice sampling to sample β . It can sample a posterior with a Normal prior. For the technical:

- Chain at $\beta^{(i)}$
- $\nu \sim \text{prior}$
- s ~ Uniform(0, posterior(β⁽ⁱ⁾))
- $\theta \sim \text{Uniform}(0, 2\pi)$
- β⁽ⁱ⁺¹⁾ = β⁽ⁱ⁾ cos θ + ν sin θ if posterior(β⁽ⁱ⁺¹⁾) > s, else try another θ with a smaller support containing zero

Even more technical:

- Initial: $[\theta_{\min}, \theta_{\max}] = [\theta 2\pi, \theta]$
- If: $\theta < 0$, $\theta_{\min} = \theta$
- Else: $\theta_{\max} = \theta$

Figure: Example of a chain

3

Instead of interpolating the model fields, we can learn the model fields on the coarse grid. We use a *Gaussian process*.

x'_{i,t} = model fields at time t, location i on coarse grid
x_{j,t} = model fields at time t, location j on fine grid

$$egin{pmatrix} x'_{1,t} \ x'_{2,t} \ dots \ x'_{M,t} \end{pmatrix} \sim \mathsf{N}(0, au^{-1}\mathbf{K})$$

We can sample the model fields on the fine grid given:

- model fields on the coarse grid
- precipitation & Z on the fine grid

We can sample the model fields on the fine grid given:

- model fields on the coarse grid
- precipitation & Z on the fine grid

$$\begin{pmatrix} x_{1,t} \\ x_{2,t} \\ \vdots \\ x_{N,t} \end{pmatrix} \begin{vmatrix} x'_{1,t} \\ x'_{2,t} \\ \vdots \\ x'_{M,t} \end{pmatrix}, \{\mathbf{Y}_{1:T}\}, \{\mathbf{Z}_{1:T}\}$$

э

• We used the model fields on a *coarse grid* to forecast the precipitation on the *fine grid*.

- We used the model fields on a *coarse grid* to forecast the precipitation on the *fine grid*.
- We have quantified uncertainity.

• The task of downscaling is computational expensive.

э

 To transistion from weather forecasting to climate prediction, we need to forecast many years into the future.

Thank you
